

**CLAIMS**

What is claimed is:

- 1           1.       A method for collecting data regarding network service operation, the  
2 method comprising:  
3           intercepting a message sent by a client and directed to a network service;  
4           storing information about the message; and  
5           transmitting the message to a destination network service.
- 1           2.       The method of claim 1, wherein intercepting a message sent by a client  
2 comprises intercepting a message sent by a network service acting in the capacity of a  
3 client.
- 1           3.       The method of claim 1, wherein intercepting a message comprises  
2 intercepting a message using a message handler that is called by the client.
- 1           4.       The method of claim 1, wherein storing information about the message  
2 comprises storing information about the message using the message handler that is  
3 called by the client.
- 1           5.       The method of claim 4, wherein storing information about the message  
2 comprises storing information about at least one of a session identification, a source  
3 name of the sender of the message, a message type, a destination name of the intended  
4 recipient, a request sent time, and substance of the message.

1           6.     The method of claim 1, further comprising interjecting instrumentation  
2 information into the message prior to transmitting the message to the destination  
3 network service.

1           7.     The method of claim 6, wherein interjecting instrumentation  
2 information comprises interjecting instrumentation information using a message  
3 handler that is called by the client.

1           8.     The method of claim 7, wherein interjecting instrumentation  
2 information comprises adding instrumentation information to a header of the message.

1           9.     The method of claim 7, wherein interjecting instrumentation  
2 information comprises interjecting at least one of a session identification, a source  
3 name of the sender of the message, a message type, a destination name of the intended  
4 recipient, and a request sent time.

1           10.    The method of claim 1, further comprising receiving a response from  
2 the destination network service and storing data regarding the response.

1           11.    The method of claim 10, wherein storing data regarding the response  
2 comprises storing data using a message handler that is called by the client.

1           12.     The method of claim 10, wherein storing data regarding the response  
2     comprises storing at least one of a session identification, a source name of the sender  
3     of the message, a message type, a destination name of the intended recipient, a request  
4     received time, a response sent time, and a response received time.

1           13.     A method for collecting data regarding network service operation, the  
2     method comprising:  
3             receiving a request from a client;  
4             intercepting a message sent by a network service and directed to the client;  
5             storing information about the message; and  
6             transmitting the message to the client.

1           14.     The method of claim 13, wherein intercepting a message comprises  
2     intercepting a message using a message handler that is called by the network service  
3     and wherein storing information about the message comprises storing information  
4     about the message using the message handler.

1           15.     The method of claim 14, wherein storing information about the  
2     message comprises storing information about at least one of a session identification, a  
3     source name of the sender of the message, a message type, a destination name of the  
4     intended recipient, a request received time, a response sent time, and substance of the  
5     message.

1           16.    The method of claim 13, further comprising interjecting  
2 instrumentation information into the message prior to transmitting the message to the  
3 client using a message handler that is called by the network service.

1           17.    The method of claim 16, wherein interjecting instrumentation  
2 information comprises interjecting at least one of a session identification, a source  
3 name of the sender of the message, a message type, a destination name of the intended  
4 recipient, a request received time, a response sent time, and substance of the message.

1           18.    A system for collecting data regarding network service operation, the  
2 system comprising:

3                means for intercepting a message sent by a client and directed to a network  
4 service;

5                means for storing information about the message;

6                means for interjecting instrumentation information into the message; and

7                means for transmitting the instrumented message to a destination network  
8 service.

1           19.    The system of claim 18, wherein the means for intercepting a message,  
2 for storing information, for interjecting instrumentation, and for transmitting comprise  
3 a message handler that is called by the client.

1           20.     The system of claim 19, wherein the message handler is configured to  
2     store at least one of a session identification, a source name of the sender of the message,  
3     a message type, a destination name of the intended recipient, a request sent time, and  
4     substance of the message.

1           21.     The system of claim 19, wherein the message handler is configured to  
2     interject at least one of a session identification, a source name of the sender of the  
3     message, a message type, a destination name of the intended recipient, and a request  
4     sent time.

1           22.     The system of claim 19, wherein the message handler is configured to  
2     receive a response from the destination network service and store data regarding the  
3     response.

1           23.     The system of claim 22, wherein the message handler is configured to  
2     store, in relation to the received response, at least one of a session identification, a  
3     source name of the sender of the message, a message type, a destination name of the  
4     intended recipient, a request received time, a response sent time, and a response  
5     received time.

1           24.     The system of claim 19, wherein the message handler is a simple object  
2     access protocol (SOAP) message handler.

1           25.    A message handler stored on a computer-readable medium, the handler  
2    comprising:  
3           logic configured to intercept messages sent by a client and directed to a  
4    network service;  
5           logic configured to store information about the message; and  
6           logic configured to transmit the message to a network service.

1           26.    The message handler of claim 25, wherein the logic configured to store  
2    information about the message comprises logic configured to store information about  
3    at least one of a session identification, a source name of the sender of the message, a  
4    message type, a destination name of the intended recipient, a request sent time, and  
5    substance of the message.

1           27.    The message handler of claim 25, further comprising logic configured  
2    to interject instrumentation information into the message.

1           28.    The message handler of claim 27, wherein the logic configured to  
2    interject instrumentation information comprises logic configured to interject at least  
3    one of a session identification, a source name of the sender of the message, a message  
4    type, a destination name of the intended recipient, and a request sent time.

1           29.    The message handler of claim 25, further comprising logic configured  
2   to receive a response from the destination network service and logic configured to  
3   store data regarding the response, the data regarding the response comprising at least  
4   one of a session identification, a source name of the sender of the message, a message  
5   type, a destination name of the intended recipient, a request received time, a response  
6   sent time, and a response received time.

1           30.    The message handler of claim 25, wherein the handler is a  
2   simpleobject access protocol (SOAP) message handler.

1           31.    A system, comprising:  
2           a network service comprising an application program interface (API) that is  
3   configured to call a message handler; and  
4           a message handler that is called by the API, the message handler being  
5   configured to intercept requests sent by the network service and directed to a  
6   supporting network service, to store information about the request, to interject  
7   information into the request, to transmit the message to the supporting network  
8   service, to receive a response from the supporting network service, and to store  
9   information about the response.

1           32.    The system of claim 31, wherein the message handler is configured to,  
2   in regard to the request, store information about at least one of a session identification,  
3   a source name of the sender of the message, a message type, a destination name of the  
4   intended recipient, a request sent time, and substance of the message.

1           33.     The system of claim 31, wherein the message handler is configured to,  
2     in regard to the response, store information about a session identification, a source  
3     name of the sender of the message, a message type, a destination name of the intended  
4     recipient, a request received time, a response sent time, and a response received time.

1           34.     The system of claim 31, wherein the message handler is a simple object  
2     access protocol (SOAP) message handler.
